A Study Of Factors Which Produce Reduced Oxidation In Experimental Pneumonia (Russian Edition) [Everette Lowell Campbell, Lyle Graham Philipps] on allamericanlocks.com *FREE* shipping on qualifying offers. This is a reproduction of a book published before Author: Everette Lowell Campbell. Oxidation often occurs with reduction. Reduction is the process of gaining electrons. When oxidation and reduction occur simultaneously, they are called oxidation-reduction, or redox, reactions.

Oxidation and reduction reactions, collectively known as redox reactions, take place in body cells and are important for the production of energy, namely ATP. Chlamydophila pneumoniae provided the first experimental evidence that C. pneumonia is able to disseminate via the blood stream throughout the body (Figure 4, #3), has been shown to promote the oxidation of LDL to its proatherogenic form and stimulate the synthesis of matrix metalloproteinases in macrophages (Kol). Studies on Oxidation and Reduction by Pneumococcus: I. Production of Peroxide by Anaerobic Cultures of Pneumococcus on Exposure to Air under Conditions Not Permitting Active Growth Description: The fact that peroxide formed and accumulated in cultural fluids in which pneumococcus grew led to this series of articles from to on certain oxidation-reduction phenomena of the pneumococcus cell.

Hepatic clearance of drugs metabolized by phase I reactions (oxidation, reduction, hydrolysis—see Common Substances That Interact With Cytochrome P Enzymes) is more likely to be prolonged in the elderly. Usually, age does not greatly affect clearance of drugs that are metabolized by conjugation (phase II reactions).
